Device thermal information

The device thermal performances below are based on UMS rules to evaluate the junction temperature.
This same procedure is the basis for junction temperature evaluation of the samples used to derive the Median lifetime and activation energy for the particular technology on which the CHA8312-99F is manufactured (GaN HEMT 0.15µm).
The temperature Tb_{chip} is defined as the chip backside temperature. The thermal resistance (Rth_eq) is given for the full circuit, and assumes CW mode is given in the table.

Thermal Resistance(1)	Rth_eq	Tb_{chip} = 85°C, Vd = 20V, Id_drive = 1.8A Pin = 24dBm, Pout = 42.4dBm Pdiss = 18.7W CW	2.37	°C/W

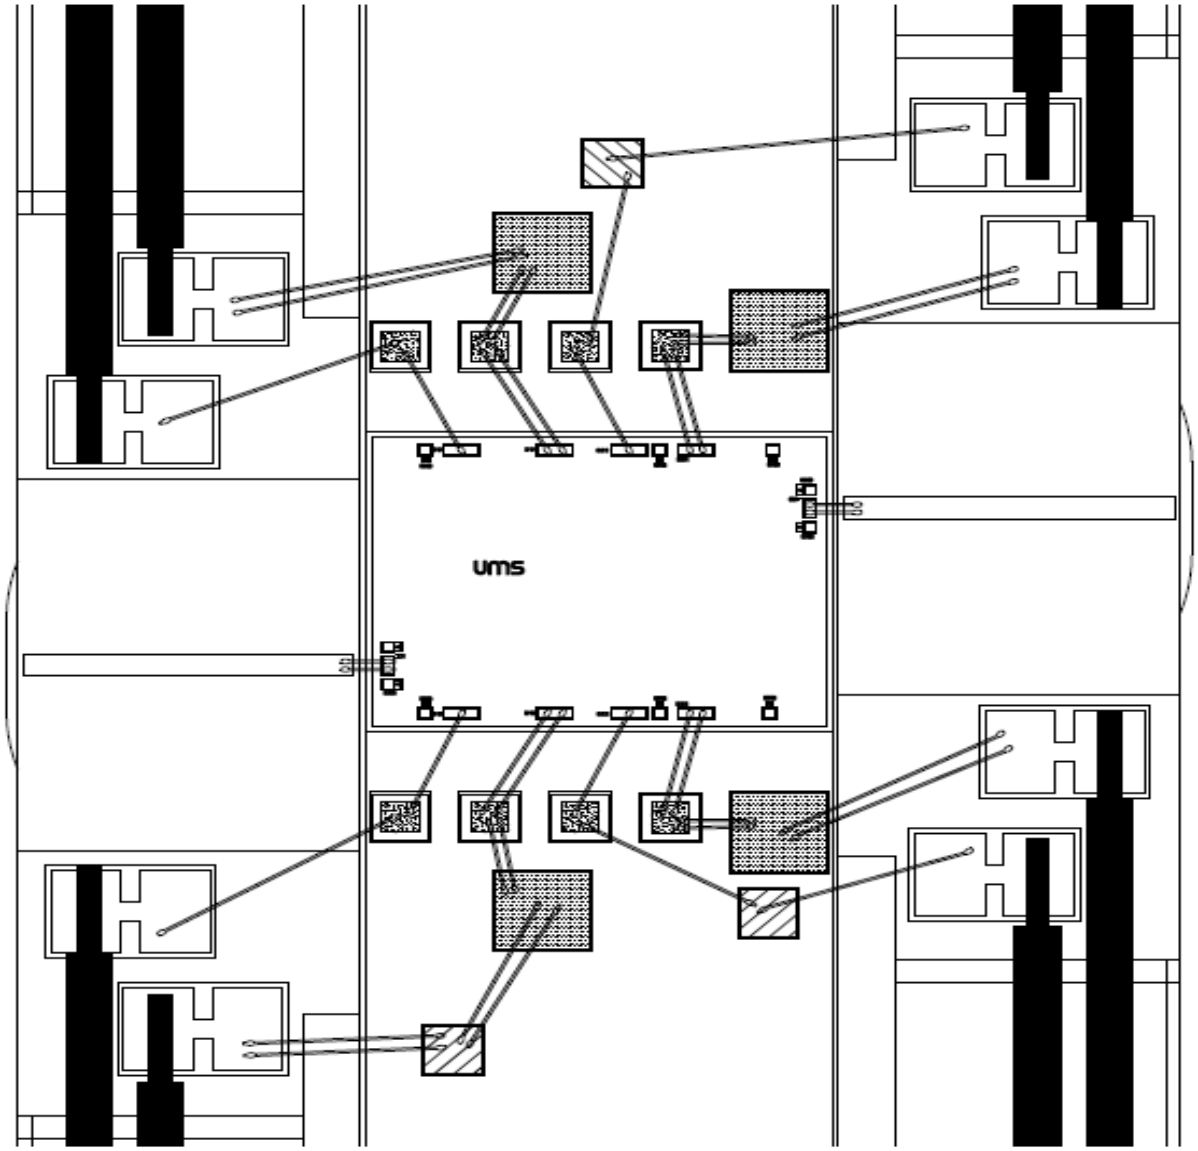
Recommended assembly plan



3 levels of decoupling capacitor have been used on drain accesses:
First level of capacitor is 120pF, second level is 10nF and third level is 100nF. Only 120pF and 10nF capacitors can be seen on the previous assembly drawing (close to the chip).

2 levels of decoupling capacitor have been used on gate accesses:
First level of capacitor is 120pF, second level is 10nF and third level is 100nF.

Note: Supply feed should be bypassed. 25µm diameter gold wire is to be preferred.
