27.5-31GHz 25W High Power Amplifier

GaN Monolithic Microwave IC

The CHA8265-98F is a 3-stage high power amplifier operating between 27.5 and 31GHz and providing typically 25W of saturated output power associated to 30% of Power Added Efficiency at 25V drain voltage. It exhibits 10W of linear power with -25dBc IMD3. This HPA is dedicated to SatCom and 5G applications and well suited for a wide range of microwave applications and systems. The circuit is manufactured on a robust GaN-on-SiC HEMT process and is available in bare die form with mechanical protection. Input and output are 50Ω matched. The drain bias range, from 18V to 25V, offers a saturated output power from 15W to 25W.

Electrical Characteristics

Tb = 25°C, Vd = 25V, Idq = 340mA, CW mode (Tb: Die backside temperature)

Symbol	Parameter	Min	Typ	Max	Unit
Freq	Frequency range	27.5		31	GHz
Gain	Linear gain		25		dB
Psat	Saturated output power		44		dBm
PAE	Power added efficiency		30		%
Id	Drain current at saturation		3.6		A
S11	Input return loss		-10		dB
S22	Output return loss		-8		dB
Idq	Quiescent current		340		mA
Vd	Drain voltage		25		V

These values are representative of on-board measurements. Measurement is de-embedded at the wire-bonding plane of the RF lines.

Absolute Maximum Ratings ⁽¹⁾

Tb = 25°C

Symbol	Parameter	Values	Unit
Vd	Drain bias voltage	27	V
Idq	Quiescent drain current (without RF signal)	1000	mA
Vg	Gate bias voltage	-7 to -1.5	V
Pin	Maximum input power	30	dBm

⁽¹⁾ Operation of this device above anyone of these parameters may cause permanent damage.

Recommended Operating Range ^{(2), (3)}

Symbol	Parameter	Values	Unit
Vd	Drain bias voltage	18 to 25	V
Idq	Quiescent drain current (without RF signal)	300 to 700	mA
Vg	Gate bias voltage	-5 to -2.5	V
Tj	Maximum junction temperature ⁽⁴⁾	200	°C
Pin	Maximum input power	28	dBm

⁽²⁾ Electrical performance is defined for specified test conditions.

⁽³⁾ Electrical performance is not guaranteed over all recommended operating conditions.

⁽⁴⁾ See Device Thermal Performance section.

Advanced Information

Temperature Range

Tb	Operating temperature range	-40 to +85	°C
Tstg	Storage temperature range	-55 to +150	°C

Typical Bias Conditions

Tb = 25°C

Symbol	Pad Number	Description	Values	Unit
Vg	4, 8, 12, 20, 24, 28	Gate voltage	-3	V
Vd	6, 10, 14, 18, 22, 26	Drain voltage	25	V

“Power ON” Sequence

1. Bias HPA gate voltage at Vg close to Vpinch-off (Typically: Vg ≈ -5V)
2. Apply Vd bias voltage (Typically: Vd = 25V)
3. Increase gate voltage Vg up to quiescent bias drain current Idq
4. Apply RF signal

“Power OFF” Sequence

1. Turn off RF signal
2. Bias HPA gate voltage at Vg close to Vpinch-off (Typically: Vg ≈ -5V)
3. Check that quiescent bias drain current Idq is close to 0mA
4. Turn Vd bias voltage to 0V
5. Check that quiescent bias drain current Idq is close to 0mA
6. Turn Vg bias voltage to 0V

Advanced Information

Device Thermal Performance

The device thermal performance below is based on UMS rules to evaluate the junction temperature. This same procedure is the basis for junction temperature evaluation of the samples used to derive the median lifetime and activation energy for the particular technology on which the CHA8265-98F is manufactured. The temperature T_b is defined as the die backside temperature. The thermal resistance (R_{th}), given in the following table, is for the full circuit in CW mode.

Parameter	Conditions	$T_{junction}$ (°C)	R_{th} (°C/W)	T_{50} (hours)
$R_{th}^{(1)}$ Thermal Resistance (Junction to die backside)	$V_d = 20V$ $I_{dq} = 340mA$ $P_{out} = 42.5dBm$ $P_{diss} = 50.9W$	164	1.54	1.9E+06
	$V_d = 25V$ $I_{dq} = 340mA$ $P_{out} = 43.5dBm$ $P_{diss} = 67.6W$	187	1.51	5.1E+05

⁽¹⁾ Assuming $T_b = 85^\circ C$

Advanced Information

Typical Board Measurements: Small Signal Performance

Test conditions: CW, $V_d = 20V / 25V$, $I_{dq} = 340mA$, $T_b = -40^\circ C / 25^\circ C / 85^\circ C$

Measurement reference is at the connector plane for S11 and S22, and de-embedded at the wire-bonding plane of the RF lines for S21.

Recommended Assembly Plan

Two levels of decoupling capacitors are recommended, one on the tab and the other on the PCB. The first level is composed of 10nF chip capacitors, the second level is composed of 1μF SMD capacitors with 10Ω SMD series resistance. The first level should be as close as possible to the die.
