T _{stg}	Storage temperature range	-55 to +150	°C

Device thermal performances

All the figures given in this section are obtained assuming that the FAB device is only cooled down by conduction through the package thermal pad (no convection mode considered).

The temperature is monitored at the package back-side interface (Tcase).

The system maximum temperature must be adjusted in order to guarantee that Tjunction remains below the maximum value specified in the Absolute Maximum Ratings table.

So, the system PCB must be designed to comply with this requirement.
