Power Bar Description

The device is composed of 4 elementary 4W cells. These cells are connected together with a specific network providing a good trade-off between performance and stability (resistance between gates and drains as described on the schematic). The reference plans are on the center of the bonding pads.

A multiport non-linear model is available on request.

Elementary Cell Maximum Gain & Stability Characteristics

$T_{ref} = +25^{\circ}\text{C}$, $V_{DS} = +30\text{V}$, $I_{D_Q} = 50\text{mA}$, simulated results

Elementary Cell Load Pull Performances

$T_{ref} = +25^{\circ}\text{C}$, $V_{DS} = +30\text{V}$, $I_{D_Q} = 50\text{mA}$, simulated results

The impedances are chosen as a trade-off between Output Power, PAE and Stability of the device. Second harmonic of output load has been tuned.

These values are given in the bonding pads reference plan.
